

7. CYBERSECURITY

Copyright Notice

2

- This presentation is presented as is. This presentation was assembled using information from various websites or sources across the web.
- This presentation uses Creative Commons Attribution 4.0 International (CC BY 4.0).

7.1: Cybercrime

7.1: Cybercrime

7.2: Cybersecurity

7.3: Common Threats

Learning Objectives

4

- Know the definitions of cybercrime and cybersecurity
- Describe cybercriminals
- List four categories of computer crimes
- Explain why you should care about cybercriminal
- Describe the difference between Computer as a Tool and Computer as a Target

Terminology

5

- **Cyber:** Relating to the **culture** of computers, information technology, and virtual reality
- **Cyberspace:** The online world of computer networks

Terminology (2)

6

- **Cybercrime:** Criminal activities carried out using computers or the internet

Terminology (3)

7

- **Cybersecurity, computer security, or IT security:**
Measures taken to protect a computer against
unauthorized access
or attack

Do I need to worry about cybersecurity?

8

- Hackers are getting more sophisticated... and more effective!
- Hackers run successful international enterprises
- Hackers hack for a living
 - ▣ That what they do, and they're very good at it!

Cybercrime is not New

9

- Computers have been hacked since their inception
- The first spam email took place in 1978 when it was sent out over **ARPANET**
- The first virus was installed on an Apple computer by a high school student 1981

Cybercriminals – No Rules!

10

- Steady increase in cybercrime
- Many nations refuse to investigate and prosecute
- Hackers and governments can access your unprotected data
- Ransomware is increasing – because it works!

What do cybercriminals do?

11

- Apply all sorts of techniques to **steal personal or financial data**
- Work silently in the background
 - ▣ They are stealthy
- Use stolen data for their gain

Who are the cybercriminals?

12

- Crackers and Hackers
 - ▣ Computer-savvy programmer who create attack software
- Script Kiddies
 - ▣ Unsophisticated computer users who know how to execute programs created by the crackers
- Criminals
 - ▣ Create & sell bots to generate spam
 - ▣ Sell credit card numbers, etc...

Cybercriminals

Cracker / Hacker:

Computer-savvy
programmer creates
attack software

Hacker Bulletin Board

SQL Injection

Buffer overflow

Password Crackers

Password Dictionaries

Script Kiddies:

Unsophisticated computer
users who know how to
execute programs

Criminals:

Create & sell bots to generate spam;
Sell credit card numbers, etc...

Successful attacks!

Crazyman broke into ...
CoolCat penetrated...

What do cybercriminals want?

14

- Make their living through cybercrimes
 - Money
 - Information
- Notoriety
 - Status, fame

Categories of Computer Crimes

- Computer as a Tool
 - Computer as the Target
 - Selling Illicit Goods
 - Offensive content or Harassment

Computer as a Tool

16

- Using a computer to target an individual
 - ▣ Spam, phishing scams, cyber theft, fraud (deception), identity theft, etc.
- These cyberthieves are scammers, not technical experts

Computer as a Target

17

- Targeting a computer or system to commit a crime
 - ▣ Viruses or malware
 - ▣ Destruction or theft of information
 - ▣ Unauthorized access of a computer or account
- A select group of people with technical knowledge commit these crimes

Selling Illicit Goods

- Using a computer to sell illicit goods
 - Drugs trafficking
 - Counterfeit products
 - Stolen items
 - Weapons
 - Organized crime groups commit these crimes

Offensive Content or harassment

19

- The content of online information may be distasteful, obscene or offensive for a variety of reasons
 - ▣ Hate speech
 - ▣ Against a group based race, religion, ethnic origin, disability, etc.
- Harassing someone through cyberspace
 - ▣ Stalking, threats of violence, cyberbullying

Common Types of Cybercrime

20

- **Phishing:** Using fake email messages to get personal information from internet users
- **Hacking:** Shutting down or misusing websites or computer networks
- **Identity theft** (misusing personal information)
- **Spreading hate and inciting terrorism;**

Cybercrime Legislation Worldwide

21

- A worldwide fight against cybercrimes
- 138 countries have created laws to fight cybercriminals
- However, 20% of countries do not have any legislation

Cybercrime Summary

22

- **Cybercrime** is any criminal activity carried out using computers or the internet
- **Cybersecurity** is taking measures to protect a computer from unauthorized access
- **Cybercriminals** exploit others for their personal gain
- **Cybercrime categories:** Computer as a tool, as the target, selling illicit goods, offensive content and harassment
- **Computer as a tool:** When an individual is a primary target
- **Computer as a target:** When a computer is a target

7.2: Cybersecurity

7.1: Cybercrime

7.2: Cybersecurity

7.3: Common Threats

Learning Objectives

- Define the goal of cybersecurity
- Describe easy targets
- Explain general guidelines of protection against cyber threats
- Describe why pirated software is not safe
- State why software updates are important
- Describe the difference between a password and a passphrase

Cybersecurity Goal

25

- Your goal is to make it **as difficult as possible** to dissuade a hacker from getting your data or from being a victim of cybercrime
- Cybercriminals go after **easy targets** unless the victim has something of great value

Good Line of Defense

26

- Can you prevent from being a victim of cybercrime?
 - ▣ If a professional hacker or government surveillance wants your information, they will get it.
- **Make them work them for it!** In doing so, they might give up and move on to an easier target
 - ▣ Minimizes the chances of being a victim

Password Cracking Example

27

- Hackers use “Brute-Force” Password Crackers
- One group cracked 2700 “bad” passwords in 30 seconds
 - ▣ The crack program ran for 48 hours more and did not crack the 250 remaining “good” passwords
- Do the hackers keep trying to get the remaining 250 passwords? Or do they find easier targets?
- **Your goal:** Be one of the 250

Are you a target?

28

- Most victims are not specifically targeted
- They are bystanders or part of a larger cybercrime operation
 - ▣ A lot of information is out of your control
 - ▣ Logins from a website you use is hacked and your password was leaked
- Control what you can control

Who are the easy targets?

29

Easy Targets

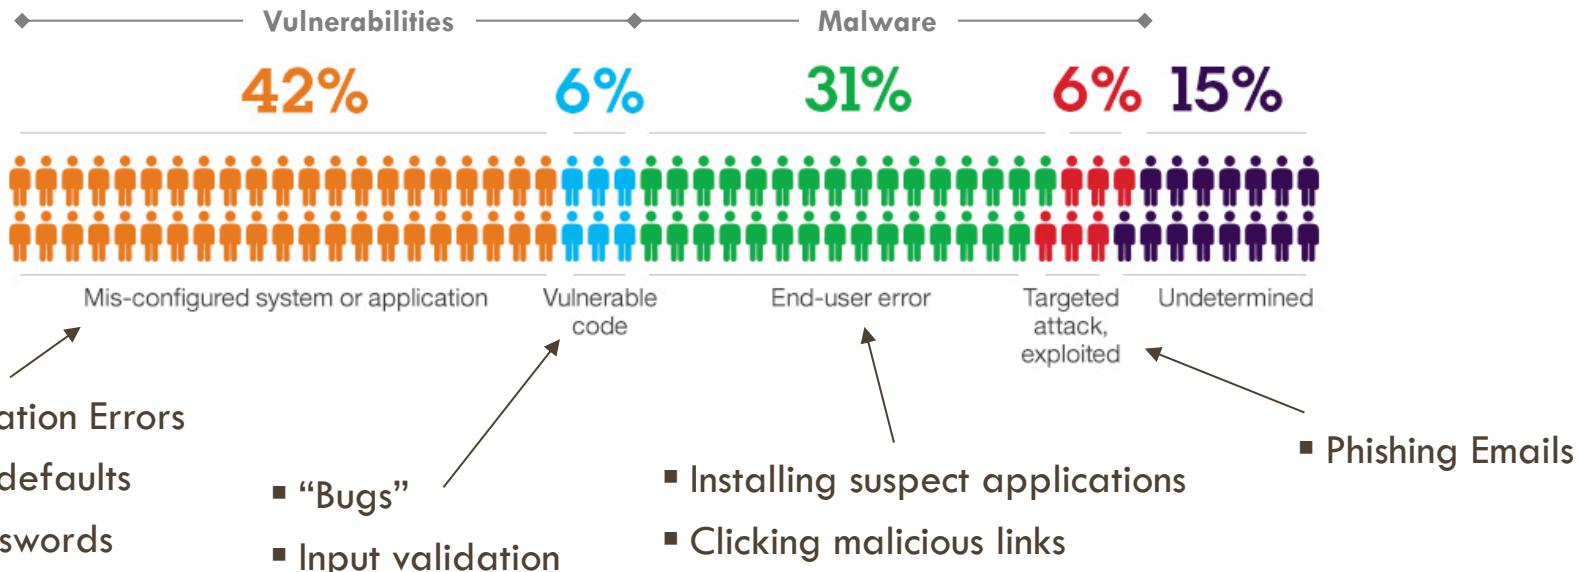

- Use weak passwords
- Reuse passwords
- Respond to spam
- Click links in emails
- Visit shady internet sites
- Run pirated software

Difficult Targets

- Security conscious
- Understand the dangers and risks
- Use encryption
- Use Two-Factor Authentication (2FA)

Why do Breaches Happen?

30

General Protection Guidelines

31

- Use official software (not pirated)
- Do not visit shady websites
- Update software regularly
- Use a reputable antivirus program
- Use strong passwords
- Do not reuse passwords

Pirated Software

32

- Pirated software is software that has been copied or distributed for free against the wishes of the creator
- Popular choices
 - Windows 7/10
 - Microsoft Office
 - Kaspersky Lab
 - Adobe products

Pirated Software (2): Created by Criminals

33

- Crackers hack software for a living
 - ▣ They **do not** do it for the goodwill of the community
 - ▣ They are not Robin Hood
- If they crack software, they do so to help their criminal enterprise
 - ▣ They can control the computers of those who install it

Pirated Software (3): Risks

34

- Pirated software contains backdoors
- Cybercriminals use your computer in many ways
 - ▣ Mine for Bitcoins or cryptocurrencies
 - ▣ Send spam
 - ▣ Launch cyber attacks
 - ▣ Monitor communications for financial information

Pirated Software (4): Assumptions

35

- All pirated software is **compromised**
- All cracking software used to hack official versions **contains malware**

Pirated Software (5): Assumptions

36

- Free download sites **can be dangerous**, even for free software, such as Adobe PDF
 - Could contain unofficial versions of the software with malware

Pirated Software (6): Food for Thought

37

- Would you install a **free lock** on your door from a mafia street vendor?
 - What are the risks?
- Similarly, **why would you trust a hacker** with your computer and data?

Pirated Software (7): Alternatives

38

- Only download software from official sources
 - ▣ microsoft.com; adobe.com; google.com; mozilla.org;
- Do not use cracking software to unlock software
- Use free alternatives
 - ▣ GIMP - GNU Image Manipulation Program
 - ▣ Linux
 - ▣ FreeOffice
 - ▣ Google Drive

Software Updates: Are they important?

39

- Crackers find new exploits all the time
 - ▣ Write software to exploit these
- Script kiddies and cybercriminals purchase the hacker's software to use the exploits
- Running up-to-date software patches these vulnerabilities

Passwords

40

- Bad passwords easily guessed by a computer program
 - ▣ Qwerty; 123456; password; superman; p@ssword
- Good passwords are long and have special characters and numbers.
 - ▣ They do not make sense, such as:
 - ▣ KN%6hGYgEqdVvAt7#W!cVk31

Passwords (2): Passphrase

41

- Use a passphrase if you need to memorize your password
 - ▣ Strong passwords require a password safe
- Memorize a passphrase (can use special letters)
 - ▣ **Positive message:** I want 2 smile more :)
 - ▣ **Random words:** Yellow-green pancakes 4bfast
 - ▣ **Some phrase:** Te@ is better with milk
 - ▣ **A memory:** Remember Turkey 2017?

Cybersecurity Summary

42

- **Goal:** Be a difficult target
- **Easy targets:** People with a low awareness of cybersecurity; don't take measures to protect themselves online
- **Protection guidelines:** Use official software that automatically updates, do not visit shady websites, and choose strong passwords
- **Pirated software:** Are tools of hackers
- **Software updates:** Fix recent exploits in software
- **Password:** UecX6JxZJ^cJ\$;
- **Passphrase:** I like d33p blue!

7.3: Common Threats

7.1: Cybercrime

7.2: Cybersecurity

7.3: Common Threats

Learning Objectives

44

- Describe the common cyber threats
- Understand how malware works
- List the ways that malware infects computers
- Describe how to protect against data leaks
- Explain the dangers links in unsolicited email
- Describe security risks when using public WiFi

Common Cyber Threats

45

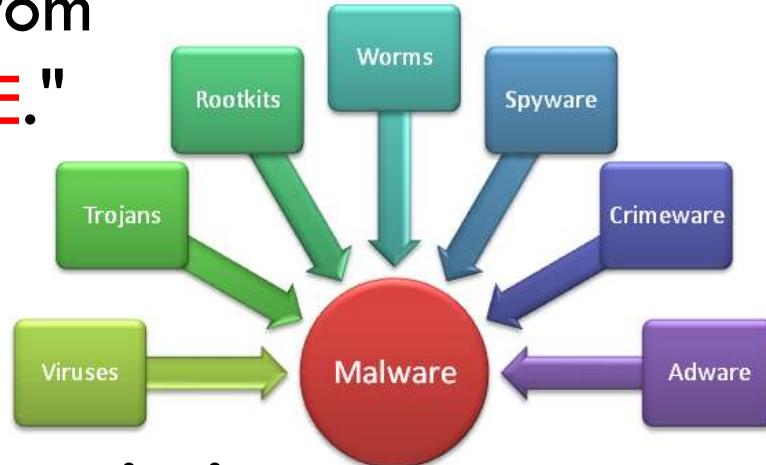

- Malware
- Data Leaks
- Unsolicited Email
- Open WiFi Networks

Malware

46

- The word "malware" comes from the term "**MALicious softWARE.**"
- Malware is any software that infects and damages a computer system **without the owner's knowledge or permission**

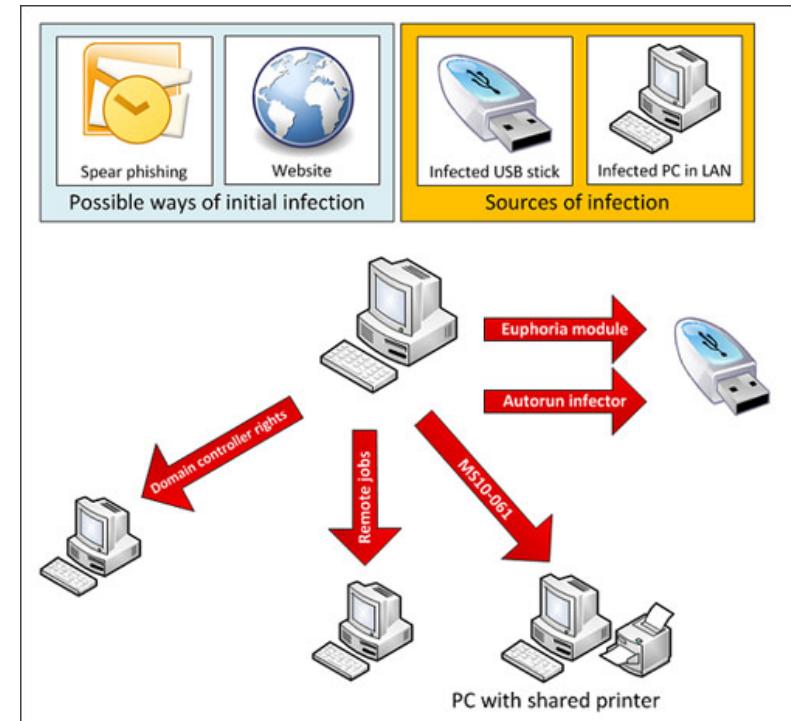

Malware (2): How Malware Operates

47

- The malicious code attaches itself to a program, file, or disk
- When the program executes, the virus activates and replicates itself
- The virus works in background, often without knowledge of the user

Malware (3): Infection Methods

- Untrusted websites
 - Clicking a link in email
 - Downloading a file
 - Malicious JavaScript
- Email attachments
- Pirated software
- Flash drives
- Another computer on the network

Malware (4): What They Do

49

- **Worms** self-replicate but do not cause harm
- **Viruses** can cause the computer crashes, loss of data,
- **Trojan horses** steal data and provide a backdoor for the cybercriminal
- **Spyware** collects data from the infected machine
- **Keyloggers** record all of a user's keystrokes
- **Fake antivirus** software allows malware to remain undetected
 - ▣ This is true for pirated/hacked antivirus software

Malware (5): Ransomware

50

- Encrypts your entire computer
- Only way to get access to your files is to pay the cybercriminal

Malware (6): Infected Computers

51

- Antivirus software can clean some malware, **but not all**
- Might require the user to reinstall the operating system
- User's data may or **may not be salvaged**

Malware (7): Protect Against

52

- Use a reputable antivirus program
- Keep your computer up to date
- Do not visit untrusted websites
 - ▣ Do not click unknown links in an email
 - ▣ Do not download files from unknown sources
- Do not use pirated software
 - ▣ Most pirated software contains malware

Data Leaks

53

- Release of secure information to an untrusted environment
- Cybercriminals frequently post hacked usernames and passwords from websites
 - One online hacker's database has 1.4 billion usernames and passwords

The 50 Most Used Passwords

- | | |
|--------------|--------------|
| 1. 123456 | 11. 123123 |
| 2. password | 12. baseball |
| 3. 12345678 | 13. abc123 |
| 4. qwerty | 14. football |
| 5. 123456789 | 15. monkey |
| 6. 12345 | 16. letmein |
| 7. 1234 | 17. shadow |
| 8. 111111 | 18. master |
| 9. 1234567 | 19. 696969 |
| 10. dragon | 20. michael |

Data Leaks (2): Data from Websites

54

DATA BREACH STATISTICS

DATA RECORDS LOST OR STOLEN SINCE 2013

9,198,580,293

ONLY 4% of breaches were “Secure Breaches” where encryption was used and the stolen data was rendered useless.

Data Leaks (3)

55

- You cannot prevent data leaks
- Instead, plan for your username, password, and other sensitive data to be leaked online

Data Leaks (4)

- Cybercriminal plan on users using the same username and password for multiple accounts

The screenshot shows the homepage of the 'Have I Been Pwned?' website. At the top, a large button with the text '';--have i been pwned?' is displayed. Below it, a subtext reads 'Check if you have an account that has been compromised in a data breach'. A search bar contains the email 'example@example.com' and a 'pwned?' button. The main content area is dark red and displays the message 'Oh no — pwned on 2 sites!'. It includes sections for 'Adobe' and 'Stratfor', each with a logo and a brief description of the data breach.

Check if you have an account that has been compromised in a data breach

example@example.com pwned?

Oh no — pwned on 2 sites!

Are you creating strong, unique passwords on all sites?

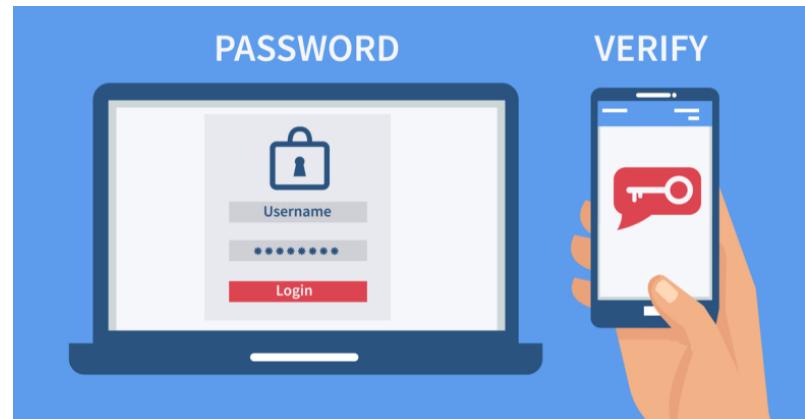

Adobe
The big one. In October 2013, 153 million accounts were breached with each containing an internal ID, username, email, *encrypted* password and a password hint in plain text. The password cryptography was poorly done and many were quickly resolved back to plain text. The unencrypted hints also disclosed much about the passwords adding further to the risk that hundreds of millions of Adobe customers already faced.

Stratfor
In December 2011, "Anonymous" attacked the global intelligence company and consequently disclosed a veritable treasure trove of data including hundreds of gigabytes of email and tens of thousands of credit card details which were promptly used by the attackers to make charitable donations (among other uses). The breach also included 860,000 user accounts complete with email address, time zone, some internal system data and MD5 hashed passwords with no salt.

Data Leaks (5): How to Plan

57

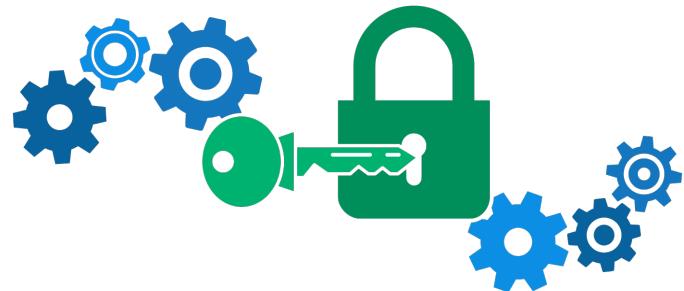

- Use a unique username and password combination for each account
- Use a password manager
 - ❑ LastPass
 - ❑ 1Password
 - ❑ KeePass
- Use two-factor authentication

Data Leaks (6): Encryption

58

- Encrypt sensitive data
 - Secure Folder (Samsung)
 - BitLocker (Windows 7/10 Pro)
 - VeraCrypt (Windows)
 - 7zip encrypts compressed files (Any)
 - The easiest to use
 - You will learn how to use 7zip in a lab

Unsolicited Email

59

- Unsolicited email is a favorite way for cybercriminal to get access to a computer or an account
- **Phishing:** Tricking the user to giving account information
- **Click Here:** The link takes a user to a malicious website

Unsolicited Email (2)

60

- ❑ **Infected attachments:** A doc, pdf, or another file that contain malicious software
- ❑ **Self-replicating:** Once you are infected, the malware uses your account to send the infected email to everyone in your address book

Unsolicited Email (2): Click Here

61

- If you click a malicious link or fall for a phishing scam, it might be too late...
 - ▣ **Drive-by downloads:** Malicious software can install just by visiting a website (virus, ransomware, keylogger)
 - ▣ **Ransomware:** 93% of all phishing emails are now ransomware

Unsolicited Email (3): Protection

62

- In addition to the malware protection guidelines:
 - ❑ Know how to identify fake email or spam
 - ❑ Never click a link in an email, not even from a friend, unless you know it is safe
 - ❑ Never click a password reset link. Instead, go to the website directly
 - ❑ Mouse over a link to verify the URL

Open WiFi Access Points

63

- **Any data transmitted through an unsecured WiFi connection can be easily collected**
 - ▣ Intercepting login credentials
 - ▣ Only use SSL/HTTPS when logging into your sites
- Understand the risks and use with care
 - ▣ Virus threat from infected users
- Better to use mobile data through your phone

Common Threats Summary

64

- Common cyber threats
 - malware, data leaks, unsolicited email, and public WiFi
- Malware is malicious software that runs the background
 - From: untrusted websites, email attachments, pirated software, infected flash drives, or infected computers on a network
- Data leaks publish private data online
- Harmful websites automatically install malware when visited
- Public WiFi expose unencrypted data, such as passwords
